

Project Proposal and Planning Phase

Date	July7, 2026
Name	Khushboo Meena
Project Name	CaptionAI: AI-Powered Social Media Caption Generator

Project Proposal (Proposed Solution)

This proposal presents **CaptionAI**, an AI-powered web application developed to simplify social media content creation. The application helps users generate engaging captions, relevant hashtags, and effective call-to-action (CTA) suggestions for different social media platforms such as Instagram, LinkedIn, and Twitter (X). By using Artificial Intelligence through the Groq API, CaptionAI reduces the time and effort required to create high-quality content while improving creativity and productivity.

1. Project Overview

Block	Content
Objective	The primary objective of CaptionAI is to help users generate engaging, platform-specific social media captions quickly using Artificial Intelligence. The application reduces manual effort and enables content creators, businesses, and marketers to create high-quality content more efficiently.
Scope	CaptionAI focuses on generating captions, hashtags, and CTA suggestions for multiple social media platforms based on user input and selected writing tone. The project provides a simple web interface, AI-powered content generation, and an easy-to-use workflow suitable for creators, marketers, and small businesses.

2. Problem Statement

Block	Content
Description	Creating engaging social media captions manually requires time, creativity, and knowledge of different platform styles. Many users struggle to produce consistent and attractive content for various social media platforms. CaptionAI solves this problem by automatically generating platform-specific captions, hashtags, and CTA suggestions using Artificial Intelligence.
Impact	The application helps users save time, improve content quality, increase productivity, and maintain consistency across different social media platforms. It also supports faster content creation for businesses, marketers, and digital creators.

3. Proposed Solution

Block	Content
Approach	CaptionAI accepts a campaign or product description from the user along with the selected platform and writing tone. The Flask backend processes the request and sends it securely to the Groq API. The AI model generates captions, hashtags, and CTA suggestions, which are then displayed on the web interface for the user.
Key Features	• AI-powered caption generation for Instagram, LinkedIn, and Twitter (X). • Platform-specific writing tone selection (Professional, Casual, Promotional). • Automatic generation of relevant hashtags. • AI-generated Call-to-Action (CTA) suggestions. • Responsive web interface with one-click copy functionality. • Secure API key management using the .env file.

4. Resource Requirements

Resource Type	Description	Specification / Allocation
Hardware	Processor	Intel Core i3/i5 or AMD Ryzen Processor
	Memory (RAM)	Minimum 4 GB RAM (8 GB Recommended)
	Storage	At least 256 GB available storage
Software	Programming Language	Python
	Framework	Flask
	Frontend Technologies	HTML, CSS, JavaScript
	AI Service	Groq API (LLaMA 3.3-70B Versatile)
	Development Environment	Visual Studio Code
	Version Control	Git & GitHub
Configuration Files	Project Configuration	<code>.env</code> , <code>.gitignore</code> , <code>requirements.txt</code>
